

## CHAPTER 5

### OVERVIEW OF THE SBSS DATABASE RECORDS

#### *Section 5A—SBSS DATABASE RECORDS.*

**5.1. Chapter Summary.** This chapter provides the formats for all SBSS database records. **Section 5A** describes the organization of these files and explains the record description entries. The attachments for **chapter 6** through **chapter 14** provide the purpose, access, record length, and specific record description entry for each database record. Each chapter covers one group of related records. The formats of the basic records are contained in **chapter 6**. **Chapter 7** provides the formats for entry/basic records. The formats for the detail records (**chapter 8**), the accounting and finance records (**chapter 9**), the fuels records (**chapter 10**), the general support records (**chapter 11**), the management support records (**chapter 12**), the tape records (**chapter 13**), and the transaction history records (**chapter 14**), make up the rest of this chapter.

**5.2. Overview.** This chapter contains the formats of the internal records stored in the SBSS database and on tape under the Standard Base Supply System. It also defines the types of record description entries used.

**NOTE:** The database records are required. They may not be altered except as permitted under program control with an authorized input. The techniques used to locate all SBSS database records are contained in **chapter 3**.

#### **5.3. U2200/400 SBSS Database.**

5.3.1. Definition of the Database. The SBSS database is a network of hierarchically structured records appropriately associated. The association allows for base-level update or retrieval of data as required by HQ USAF. The SBSS database is a SPERRY DMS-1100 database following Conference for Data Systems Language (CODASYL) Worldwide Standards Committee specifications. It is defined by a schema and one or more subschemas. The schema and subschema make up a set of tables that contain the computer code necessary for programs to gain access to the database. The Data Definition Language (DDL) processor (SPERRY UP-7907 Data Management System (DMS 1100) Level 8R1, Schema Definition, Data Administrator) describes the characteristics of the entire database. Through the use of the data contained in the parentheses, the DDL creates the schema.

5.3.2. Organization of the Database. The construction of the database provides the ability to partition related records and sets. The database allows maximum flexibility in the acquisition and placement of data with a minimum amount of time and storage requirements. The database is currently divided into 257 areas, 236 records (of which 160 are base level and 96 are for HQ Standard Systems Group (HQ SSG) use only), and 50 sets for each Base Supply host account. Each area contains one or more types of records as shown in the schema. The SBSS record types are grouped into nine categories. (These are described in **chapter 6** through **chapter 14**.)

5.3.3. Storage Requirements. Due to variance in record occurrence and hardware configurations from base to base, the size of the areas is tailored to meet each base's needs. The minimum and maximum disk storage are changed to meet individual base needs at the time of the system generation or upload. The SBSS database requires a minimum disk storage of 1,420,720 words and a maximum disk storage of 20,950,160 words.

5.3.4. Labeling/Tagging Conventions. Each record identified in the schema is assigned a unique record code. The SBSS uses three characters for record code assignments. All data elements within each record use the record code as the first three characters for identification purposes.

5.3.5. Creation of Subschemas. The creation of subschemas limits a user's view of the database to subsets of the areas, records, sets, and data names described by the schema. The subschemas provide a description of the views of the database. The use of a subschema provides important protection for sensitive information and permits access to only as much of the database as the user is permitted to see. The subschema is created by the subschema Data Definition Language (SDDL) processor (SPERRY UP-8505 Data Management System (DMS 1100) Level 8R1, Subschema Definition).

5.3.6. Schema/Subschema Identification. The SBSS absolute schema is identified as SBSS-SCHEMA and resides in a file called DMS\$<ALN>\*SBSS-SCHEMA. The SBSS absolute subschemas also reside in file DMS\$<ALN>\*SBSS-SCHEMA.

**EXAMPLES:** The absolute schema DMS\$<ALN>\*SBSS-SCHEMA.SBSS-SCHEMA allows the users to access the entire SBSS database. The subschema DMS\$<ALN>\*SBSS-SCHEMA.SBSS-QLP1 allows access only to records residing on Gang 1.

#### **5.4. Cross-Reference - SBSS Database Record Number to Chapter/Attachment.**

**Table 5.1. SBSS Database Record Number to Chapter/Attachment.**

RECORD NUMBER & NAME	REFERENCE
